

Compatibility admissibility under turbulence

Gate 3 compares κ_{gate} against a σ -adjusted requirement $\kappa_{\text{req}}(\sigma)$.

GeoRSCT caveat

In geospatial data, high σ may reflect spatial heterogeneity, not solver chaos.

Therefore λ and κ_{base} are reported as gate-policy parameters.

Canonical turbulence: $\sigma = \text{std}(\{\kappa_i\}_{i=1}^m)$.

Use this figure for gate-policy explanation, not as a default GeoRSCT leaderboard metric.
