

GeoRSCT evaluates compatibility across problems, representations, and solvers

Each ZCTA-level target is tested under six embedding families with a fixed HistGBDT solver to separate task difficulty from representation quality.

Formula discipline

$R\text{-squared}(f,t)$ -- per embedding-task pair

$N\text{-ceiling}(t) = 1 - \max_k(R\text{-sq}_k(t))$

$kappa\text{-theory} = D^*/D$ (difficulty ratio)

$kappa\text{-req}(\sigma) = kappa\text{-base} + \lambda \cdot \sigma$
